

5 Stocks to Buy Now for the Next **Bitcoin Bull Run**

A thesis-driven note on the five listed equities I believe are best positioned to outperform Bitcoin itself over the 2026–2029 cycle — and why the current bear market is the window to build the position.

Why I Am Buying These Stocks Now

Bitcoin trades at roughly **\$63,600** today, around **49% below** the **\$126,000** all-time high set in early October 2025. On the four-year cycle framework that has governed every previous Bitcoin market, this drawdown is the late stage of a bear market that began in October 2025 and, in my view, ends around **October 2026** — opening a bull market that runs into **late 2029**.

What makes this bear market interesting is how shallow it is. Every prior Bitcoin cycle bottomed between **77% and 93%** below its peak; this one is around 50%. That is consistent with an ownership base that has shifted from retail speculators to ETFs, corporate treasuries and institutions — holders structurally less willing to sell.

FROM OCT 2025 PEAK

77-93%

TYPICAL PRIOR BEAR DRAWDOWN

The trade is not simply "buy Bitcoin"

If I only wanted Bitcoin exposure I would buy Bitcoin. The purpose of this portfolio is to **outperform** it. Every company here is levered to the Bitcoin price through one of two mechanisms: it holds Bitcoin on its balance sheet and finances further purchases through capital markets, or it earns fees and interest that expand as crypto and stablecoin activity expands. In both cases a rising Bitcoin price flows through at a multiple — not one-for-one.

The premium has already been paid down for you

The most important number in this note is **mNAV** — the ratio of a treasury company's enterprise value to the market value of the Bitcoin it holds. In November 2024, at the peak of the enthusiasm, Strategy traded at roughly **3.4×** the value of its Bitcoin: \$3.40 paid for a dollar of Bitcoin on the balance sheet.

Today Strategy trades at an enterprise-value mNAV of roughly **1.06×** and Strive at **1.14×**. On a common-equity basis they are lower still — Strategy's basic mNAV sits near **0.70×**, below the market value of the Bitcoin behind it. The speculative premium of 2024 has been fully wrung out. You are buying the same company, running the same strategy, holding far more Bitcoin than it did then — at roughly the value of the Bitcoin itself.

The two engines behind a 5-10X

A treasury stock can multiply through two independent forces: the **Bitcoin price** rising, and the **mNAV multiple** re-rating from today's ~1.0× back toward the premiums that historically appear in bull markets. Bitcoin tripling alone is roughly a 3×. Bitcoin tripling *while* the multiple expands from 0.7× to 1.5× is closer to 6×. That is the entire mathematical basis for the 5-10X target.

The condition attached to this entire report

This thesis has one assumption and it is not hedged. Every position here requires the Bitcoin price to be materially higher in two to three years than it is today. If Bitcoin does not rise, these stocks will not rise — and the leverage that produces the upside works identically in reverse. Buy these only if you are genuinely bullish on Bitcoin over that horizon.

Bitcoin Treasury Companies

Three companies whose business is accumulating Bitcoin and issuing credit against it — my highest-conviction narrative for the cycle.

01 MSTR

Strategy Inc (formerly MicroStrategy) · Nasdaq

\$96.09

Buy below \$120 · in buy zone

HIGHEST CONVICTION

LOW RISK

BITCOIN TREASURY

Strategy is the largest corporate holder of Bitcoin in the world and the originator of the entire treasury-company model. As of 9 August 2026 it held **840,447 BTC** at an aggregate cost of **\$63.36 billion**, an average purchase price of **\$75,385**. At today's Bitcoin price that stack is worth approximately **\$53.4 billion** against a market capitalisation of roughly **\$37.7 billion**.

That is the trade. Every share carries roughly **\$136 of Bitcoin** and costs **\$96**. The market is pricing Strategy's Bitcoin at a discount to spot — a situation that did not exist at any point in the last bull market, when the same company traded above three times the value of its holdings.

Bitcoin held (9 Aug 2026)	840,447 BTC	mNAV (enterprise value basis)	~1.06×
Average purchase price	\$75,385	mNAV (basic / common equity)	~0.70×
Market value of Bitcoin held	~\$53.4 bn	Peak mNAV, Nov 2024 → today	~3.4× → ~1.06×
Market capitalisation	\$37.7 bn		

Strategy also runs a listed preferred complex — STRF, STRK, STRC and STRD — letting it raise capital at fixed cost without diluting common shareholders at depressed prices. This is the foundation of a genuine **digital credit market** built on Bitcoin collateral, and it is why I treat Strategy as an operating financial business rather than a passive holding vehicle. If you buy one name in this note, buy this one.

02 ASST

Strive Inc · Nasdaq

\$12.62

Buy below \$15 · in buy zone

HIGHEST CONVICTION

LOW RISK

BITCOIN TREASURY

Strive is the small-cap expression of the same thesis and the sector's most aggressive consolidator. In January 2026 Semler Scientific shareholders approved Strive's all-stock acquisition, folding Semler's **5,048 BTC** into the treasury for a combined **12,798 BTC** at closing — then the eleventh-largest corporate holding globally, ahead of Tesla and Trump Media. Accumulation has since taken holdings to roughly **19,000 BTC**, worth about **\$1.2 billion** today.

It funds itself through **SATA**, a Nasdaq-listed perpetual preferred paying a monthly cash dividend at a variable rate lifted to **12.75%** and managed to trade between \$95 and \$105 — a permanent, non-dilutive capital source. Strive has also invested \$50 million in Strategy's STRC preferred, treating digital credit as a business line rather than merely a funding mechanism.

Bitcoin held (approx.)	~19,000 BTC	SATA preferred dividend	12.75% monthly cash
Market value of Bitcoin held	~\$1.21 bn	Corporate holder rank at merger	11th globally
mNAV (enterprise value basis)	~1.14×		

The case for owning Strive alongside Strategy is size: a company holding 19,000 BTC can double its stack far more easily than one holding 840,000, and small caps re-rate hardest when liquidity returns. Note the **1-for-20 reverse split** executed with the merger — historical price charts are not directly comparable.

03 MTPLF

Metaplanet Inc · US OTC (Tokyo listing 3350.T)

\$1.43

Buy below \$2 · in buy zone

HIGH CONVICTION

MODERATE RISK

BITCOIN TREASURY

Metaplanet is Asia's largest corporate Bitcoin holder and the only non-US company in the global top ten. It has accumulated relentlessly through the bear market: **5,075 BTC** in Q1 2026 for \$398 million and **2,823 BTC** in Q2 for \$221 million, taking holdings to roughly **43,000 BTC** – second globally among corporate holders. Management targets **100,000 BTC by end-2026** and **210,000 BTC by end-2027**.

Under its Project Nova strategy it agreed to acquire **Siiibo Securities**, a licensed Japanese broker, to launch Bitcoin-backed securities and lending domestically – converting Metaplanet from a holding vehicle into a Japanese digital credit issuer, the same evolution Strategy is making in the US but in a market with almost no competition.

Bitcoin held (approx.)	~43,000 BTC	Stated target, end 2027	210,000 BTC
Market value of Bitcoin held	~\$2.73 bn	Tokyo price (3350.T)	~¥224
Stated target, end 2026	100,000 BTC	52-week range (Tokyo)	¥192 - ¥1,068

The rating is moderate rather than low for two reasons: the shares are roughly 80% below their 52-week high, and the US OTC line is less liquid than the Tokyo listing. Buy MTPLF if your broker offers OTC access, or **3350** directly on the Tokyo Stock Exchange if it does not.

Why these three sit together

These are the same trade at three sizes: mega-cap, small-cap and international. All three are still buying Bitcoin through the bear market, all three are building credit products on top of their holdings, and all three trade at or near the value of the Bitcoin they own. Spreading across all three avoids concentrating in a single management team, jurisdiction or capital structure.

A note on how the 5–10X target is derived

The table below shows the arithmetic for Strategy, using \$136 of Bitcoin NAV per share at today's price and a constant share count. It is a sensitivity illustration, not a forecast, and ignores both further accumulation (historically a positive for Bitcoin per share) and dilution.

SCENARIO	BTC PRICE	BTC NAV / SHARE	AT 1.0× MNAV	AT 1.5× MNAV
Bitcoin reclaims prior high	\$126,000	\$270	2.8×	4.2×
Bitcoin triples from here	\$191,000	\$408	4.2×	6.4×
Bitcoin quadruples from here	\$254,000	\$544	5.7×	8.5×

Multiples shown are returns on the current \$96.09 share price. The same mechanism applies to Strive and Metaplanet with greater sensitivity, since both are smaller and hold proportionally more Bitcoin relative to their market values.

03 – THE SECOND NARRATIVE

Stablecoins and Tokenisation

Two regulated businesses that earn from crypto activity rather than holding Bitcoin – a revenue-generating counterweight to the treasury names.

04 CRCL

Circle Internet Group · NYSE

\$71.16

Buy below \$75 · in buy zone

HIGH CONVICTION

MODERATE RISK

STABLECOIN · TOKENISATION

Circle issues **USDC**, the second-largest stablecoin and the dominant one in regulated flows — roughly **70% of stablecoin transaction volume**. Since the GENIUS Act became law, dollar stablecoins are a licensed, federally supervised payment rail in the US, with reserve and audit standards Circle already satisfied before the rules were written. The framework takes full effect in **January 2027**, precisely as the bull market I expect gets underway.

The business is now profitable and growing. Q2 2026 revenue and reserve income was **\$701 million**, up 7% year on year, with adjusted EBITDA of **\$143 million** and net income near **\$48 million** — a swing from a substantial loss a year earlier. First-half revenue reached **\$1.25 billion**, and USDC in circulation was **\$77.0 billion** at the end of Q1, up 28%.

USDC in circulation (Q1 2026)	\$77.0 bn (+28% YoY)	Share of stablecoin volume	~70%
Q2 2026 revenue & reserve income	\$701 m (+7% YoY)	IPO price / all-time high	\$31 / \$298.99
Q2 2026 net income	~\$48 m		

CRCL is the number one listed way to express the stablecoin narrative: the stock is roughly 76% below its all-time high while the business is larger and, for the first time, profitable. The moderate risk rating reflects the model's real vulnerability — most revenue is interest on reserves, so falling policy rates compress margin even as USDC supply grows.

05
COIN

Coinbase Global · Nasdaq · S&P 500

\$148.58

Buy below \$175 · in buy zone

HIGH CONVICTION LOW RISK STABLECOIN · TOKENISATION

Coinbase is the largest regulated crypto exchange in the US and the first crypto company admitted to the **S&P 500**. It is also a direct beneficiary of the Circle thesis, earning **\$292 million** of stablecoin revenue in Q2 2026 with average USDC held on platform at a record **\$20 billion** — over **30% of all USDC in circulation**. Owning both CRCL and COIN is not duplication; it is holding the issuer and the largest distributor of the same asset.

What matters is how the business looks at the bottom of a cycle. Q2 revenue of **\$1.2 billion** fell 19% year on year and the company posted a GAAP net loss of **\$359 million** — yet subscription and services revenue reached **\$555 million**, now **48% of net revenue** against \$6 million six years ago, and trading market share hit a record **10.3%**, a third consecutive quarterly gain. Coinbase is taking share and diversifying away from trading fees in the worst possible tape.

Q2 2026 total revenue	\$1.20 bn (−19% YoY)	Subscription & services revenue	\$555 m (48% of net)
Q2 2026 GAAP net result	−\$359 m	Trading volume market share	10.3% (record)
Stablecoin revenue	\$292 m	All-time high (Jul 2025)	\$444.65

Add the **Deribit** acquisition, which made Coinbase the global leader in crypto derivatives by open interest, and the **OCC conditional approval** for a national trust charter in April 2026, unlocking institutional custody mandates. Coinbase enters this bull market with more product surface, more market share and a stronger regulatory position than it had entering the last one — at roughly a third of its former share price.

Portfolio Summary, Timing and Risk

TICKER	COMPANY	PRICE	BUY BELOW	CONVICTION	RISK
MSTR	Strategy Inc	\$96.09	\$120	Highest	Low
ASST	Strive Inc	\$12.62	\$15	Highest	Low
MTPLF	Metaplanet Inc	\$1.43	\$2	High	Moderate
CRCL	Circle Internet Group	\$71.16	\$75	High	Moderate
COIN	Coinbase Global	\$148.58	\$175	High	Low

All five names trade inside their buy ranges as of 12 August 2026. The buy-below levels are the decision rule, not the current price.

Timing: accumulate now, hold through the bull

The accumulation window runs until approximately **9 October 2026** — a matter of weeks, not months. Buy on a schedule and buy weakness rather than waiting for a bottom only identifiable in hindsight. The historical pattern places the cycle peak around **August–September 2029**.

The rule I follow

Buy aggressively before 9 October 2026. Hold through the bull market. Sell in tranches into strength between 2028 and late 2029. Never deploy capital you cannot leave untouched for the full three years.

Risks I am accepting

A bullish report that does not state its risks is marketing, not research. These are the specific ways this thesis loses money.

- ! **The cycle thesis is wrong.** The four-year pattern is an observed regularity, not a law. If Bitcoin does not advance from late 2026, every position here underperforms.
- ! **mNAV can stay below 1.0×**. A discount to Bitcoin NAV is only an opportunity if it closes, and these companies cannot force it to.
- ! **Preferred dividends are fixed obligations.** Strategy's preferred complex and Strive's SATA pay cash regardless of the Bitcoin price; a long bear market makes that harder to service and can force issuance at poor prices.
- ! **Dilution.** These companies fund purchases by issuing securities, so Bitcoin per share can fall even as total holdings rise.
- ! **Rate and volume sensitivity.** Circle earns ~95% of revenue from reserve interest, so rate cuts compress margin; Coinbase depends on trading volume and lost money in Q2 2026.
- ! **Liquidity and jurisdiction.** MTPLF is a thinly traded OTC line, and Metaplanet adds Japanese regulatory and yen exposure on top of Bitcoin risk.
